

Beaverton Population Density

Aggregated vs Disaggregated Data

This raster shows population per cell. The values were generated from population density calculations, expected population and observed total population. Utilizing a land use/relative density classification index, the expected population can be found.

Population per 130 sq ft
raster cell

This vector map shows the population density per US census block group area. This representation distributes population homogenously in each block group. Doing so creates a generalized and potentially misleading representation of population distribution.

Population 2010 / Block Area
in sq ft
